Zooplankton of Çat Dam Lake (Malatya-Turkey) with a new record for Turkish rotifers

*Lecane intrasinuata* (Olofsson, 1917)

**Keywords:** Rotifera, *Lecane intrasinuata*, New record, Turkey, Çat Dam Lake

**Introduction**
There are many studies on the zooplankton of Turkish lakes, many of which are about seasonal fluctuations, distribution and hydrological changes. In recent years many scientists focused their attention on the zooplankton of Turkish inland waters (Dumont and De Ridder, 1987; Segers *et al*., 1992).

The family Lecanidae consists of one genus, *Lecane* Nitzsch, 1827 with about 200 species. This genus is the most common rotifer species inhabiting in various aquatic environments (Segers 1994, 1995, 2008). They are from Monogonont rotifers and are diagnosed by the retractile head, the structure of the foot and toes and by the trophy in the female (Segers, 1995). Lecanids have got a loricate body and the body is compressed dorso-ventrally. The dorso-ventral plates are connected by a flexible membrane. The feet have got two primitive segments of which only the posterior is movable. Toes varied remarkably within individuals of the same species (Arora, 1965). Their bodies resemble each other which causes difficulties in identifying species (Segers *et al*., 1992).

**Materials and methods**
Çat Dam Lake was established on Abdulvahap Stream for irrigation and is located 68 km south of Malatya. The Dam lake volume is 240 hm³ and lake area is 14 km². Sampling stations are shown in Fig. 1, and listed with sampling coordinates in Table 1.
Plankton samples were collected using a standard Hydro-bios plankton net (55 μm mesh size) from Çat Dam Lake on 02.20.2013 from six stations. Zooplankton samples were fixed in 4% formalin solution. Specimens were analysed under Leitz inverted microscope and identified under Nicon Eclipse 80i microscope and drawings were made using camera lucida.

**Results and discussion**

From Çat Dam Lake, 19 zooplankton species (15 species from Rotifera, 2 species from Cladocera and 2 species from Copepoda) were identified. The species *L. intrasinuata* was not reported in any study in Turkey until now (Ustaoğlu *et al.*, 2012; Ustaoğlu, 2015). Therefore, this species is a new record for the Turkish rotifer fauna.

List of zooplankton species recorded in Çat Dam Lake was given below.

**Phylum Rotifera Cuvier, 1817**
**Class Euroatoria De Ridder, 1957**
**Subclass Monogononta Plate, 1889**
**Superorder Pseudotocha Kutikova, 1970**
**Order Ploimia Hudson & Gosse, 1886**
**Family Brachionidae Ehrenberg, 1838**
**Genus Keratella Bory de St Vincent, 1822**
*Keratella cochlearis* (Gosse, 1851)
*K. tecta* (Lauterborn, 1900)
*K. quadrata* (Müller, 1786)
Genus *Notholca* Gosse, 1886  
*Notholca squamula* (Müller, 1786)

Genus *Kellicottia* Ahlstrom, 1938  
*Kellicottia longispina* (Kellicott, 1879)

Family Euchlanidae Ehrenberg, 1838  
*Euchlanis* Ehrenberg, 1832  
*Euchlanis dilatata* Ehrenberg, 1832

Family Lecanidae Remane, 1933  
*Euchlanis* Ehrenberg, 1832  
*Lecane luna* (Müller, 1776)  
*L. lunaris* (Ehrenberg, 1832)  
*L. intrasinuata* (Olofsson, 1917)

Family Trichocercidae Harring, 1913  
*Trichocerca* Lamarck, 1801  
*Trichocerca capicina* Wierzejski & Zacharias, 1893  
*Trichocerca similis* (Wierzejski, 1893)

Family Synchaetidae Hudson & Gosse, 1886  
*Polyarthra dolichoptera* (Idelson, 1925)

Family Asplanchnidae Eckstein, 1883  
*Asplanchna* Gosse, 1850  
*Asplanchna priodonta* Gosse, 1850

Superorder Gnesiotrocha Kutikova, 1970

Order Flosculariacea Harring, 1913

Family Conochililidae Harring, 1913  
*Conochilus* Ehrenberg, 1834  
*Conochilus dossuarius* (Hudson, 1885)

Family Filinidae Harring & Myers, 1926  
*Filinia* Bory de St. Vincent, 1824  
*Filinia terminalis* (Plate, 1886)

Phylum Arthropoda Latreille, 1829

Subphylum: Crustacea Brünnich, 1772

Subclass Phyllopoda Preuss, 1951

Order Diplostraca Gerstaecker, 1866

Suborder Cladocera Latreille, 1829

Family Daphniidae Sars, 1930  
*Daphnia* Müller, 1785  
*Daphnia longispina* Müller, 1875  
*Family Bosminidae Baird, 1845  
*Genus Bosmina* Baird, 1845  
*Bosmina longirostris* (Müller, 1785)

Class Maxillopoda Dahl, 1956

Subclass Copepoda H.Milne-Edwaeds, 1840

Infraorder Neocopepoda Huys & Boxshall, 1991

Superorder Gymnoplea Giebesbrecht, 1882

Order Calanoida Sars, 1930

Family Diaptomidae Sars, 1903  
*Genus Acanthodiaptomus* Kiefer, 1932  
*Acanthodiaptomus denticornis* (Wierzejski, 1887)

Superorder Podoplea Giesbrecht, 1882

Order Cyclopoida Sars, 1918

Family Cyclopoidae Sars, 1913

Subfamily Cyclopinae Kiefer, 1927  
*Genus Cyclops* Müller, 1785  
*Cyclops vicinus* Uljanin, 1875

Distribution of zooplankton species among 6 stations in Çat Dam Lake is given in Table 2.

Family Brachionidae was found as the most dominant group (with 5 species, *K. cochlearis*, *K. quadrata*, *K. tecta*, *K. longispina* and *N. squamula*). In some dam lakes like Göksu (Bekleyen, 2003), Cip (Saler and Şen, 2000), Birecik (Bozkurt and Sagat, 2008), Beyhan (Bulut and Saler 2014), Kalecik (Bulut and Saler 2013) Dam Lakes species from Brachionidae represented most of the species.

In Çat Dam Lake *K. cochlearis* and *K. quadrata* were the most abundant species in this study followed by *Lecane* spp. Among zooplankton groups Rotifer was observed in high number of individuals and species diversity. This profile was in accordance with zooplankton distribution of dam lakes in Turkey (Bekleyen, 2003; Kaya and Altındağ, 2007; Özdemir Mis *et al.*, 2009; Saler and İpek Alış, 2014; Saler *et al.*, 2014).

The first Turkish inland water zooplankton list was made by Emir (1996) and she reported 167 species. Ustaoğlu (2004), reported 229 rotifer species from Turkish inland waters. In the Tigris River Bekleyen *et al.* (2011) identified 34 new Rotifer species. Ustaoğlu *et al.* (2012) recorded 341 rotifer taxa from Turkey. Ustaoğlu (2015), updated the rotifer species number as 417. Among these rotifer species *L. intrasinuata* has not been mentioned (Fig. 2).

**Figure 2:** General view of *Lecane intrasinuata*. A. Ventral B. Dorsal.

**Family Lecanidae Remane, 1933**

*Lecane intrasinuata* (Olofsson, 1917)

**Syn:** *L. ephestra* Harring, 1921

**Syn:** *L. mylacris* Harring & Myers, 1926 (Segers, 2007).

The features of *L. intrasinuata* were given below.
Differential diagnosis

*L. intrasinuata* is confused with *L. stichaea*. *L. intrasinuata* has got a smooth lorica and the width of its lorica is greater than that of *L. stichae*. Its ventral plate width is about two thirds of its length and the plate is slightly swollen. The foot is shorter than in *L. flexilis*, and the presence of pseudoclaws distinguishes the species from *L. haliclysta*, *L. stichoclysta* and *L. verecunda*.

Description

Lorica is stiff, dorsal plate is anteriorly narrower, and medially wider than the ventral plate. The plate is smooth. Head aperture margins are dorsally and ventrally slightly convex or straight, coincident, with small antero-lateral spines. Ventral plate is longer than its width. Lateral margins curved, irregularly undulate, with anterior notches. Toes are parallel-sided, bearing pseudoclaws.

Measurements

DPI. 52-135, DPw. 68-101, VPI. 56-125, VPw. 36-76, toe 15-26, claw 4-6.

Distribution

According to Segers (1995), it was found in the northern temperate zone only. He also reported a record from a pond near Alexandrowsk from Norway Fig. 2.
