Zooplankton of Çat Dam Lake (Malatya-Turkey) with a new record for Turkish rotifers

*Lecane intrasinuata* (Olofsson, 1917)

**Keywords:** Rotifera, *Lecane intrasinuata*, New record, Turkey, Çat Dam Lake

**Introduction**
There are many studies on the zooplankton of Turkish lakes, many of which are about seasonal fluctuations, distribution and hydrological changes. In recent years many scientists focused their attention on the zooplankton of Turkish inland waters (Dumont and De Ridder, 1987; Segers *et al*., 1992).

The family Lecanidae consists of one genus, *Lecane* Nitzsch, 1827 with about 200 species. This genus is the most common rotifer species inhabiting in various aquatic environments (Segers 1994, 1995, 2008). They are from Monogonont rotifers and are diagnosed by the retractile head, the structure of the foot and toes and by the trophy in the female (Segers, 1995). Lecanids have got a loricate body and the body is compressed dorso-ventrally. The dorso-ventral plates are connected by a flexible membrane. The feet have got two primitive segments of which only the posterior is movable. Toes varied remarkably within individuals of the same species (Arora, 1965). Their bodies resemble each other which causes difficulties in identifying species (Segers *et al*., 1992).

**Materials and methods**
Çat Dam Lake was established on Abdulvahap Stream for irrigation and is located 68 km south of Malatya. The Dam lake volume is 240 hm³ and lake area is 14 km². Sampling stations are shown in Fig. 1, and listed with sampling coordinates in Table 1.
Table 1: Sampling coordinates.

Results and discussion
From Çat Dam Lake, 19 zooplankton species (15 species from Rotifera, 2 species from Cladocera and 2 species from Copepoda) were identified. The species *L. intrasinuata* was not reported in any study in Turkey until now (Ustaoğlu *et al*., 2012; Ustaoğlu, 2015). Therefore, this species is a new record for the Turkish rotifer fauna. List of zooplankton species recorded in Çat Dam Lake was given below.

**Phylum Rotifera Cuvier, 1817**

**Class Euroatoria De Ridder, 1957**

**Subclass Monogononta Plate, 1889**

**Superorder Pseudotocha Kutikova, 1970**

**Order Ploimia Hudson & Gosse, 1886**

**Family Brachionidae Ehrenberg, 1838**

**Genus Keratella Bory de St Vincent, 1822**

*Keratella cochlearis* (Gosse, 1851)
*K. tecta* (Lauterborn, 1900)
*K. quadrata* (Müller, 1786)
Genus *Notholca* Gosse, 1886  
*Notholca squamula* (Müller, 1786)  
Genus *Kellicottia* Ahlstrom, 1938  
*Kellicottia longispina* (Kellicott, 1879)  
Family Euchlanidae Ehrenberg, 1838  
Genus *Euchlanis* Ehrenberg, 1832  
*Euchlanis dilatata* Ehrenberg, 1832  
Family Lecanidae Remane, 1933  
Genus *Lecane* Nitzch, 1827  
*L. lunaris* (Ehrenberg, 1832)  
*L. intrasinuata* (Olofsson, 1917)  
Family Trichocercidae Harring, 1913  
Genus *Trichocerca* Lamarck, 1801  
*Trichocerca capucina* Wierzejski & Zacharias, 1893  
*Trichocerca similis* (Wierzejski, 1893)  
Family Synchaetidae Hudson & Gosse, 1886  
*Polyarthra dolichoptera* (Idelson, 1925)  
Family Asplanchnidae Eckstein, 1883  
Genus *Asplanchna* Gosse, 1850  
*Asplanchna priodonta* Gosse, 1850  
Superorder Gnesiotrocha Kutikova, 1970  
Order Flosculariacea Harring, 1913  
Family Conochililidae Harring, 1913  
Genus *Conochilus* Ehrenberg, 1834  
*Conochilus dossuarius* (Hudson, 1885)  
Family Filinidae Harring & Myers, 1926  
Genus *Filinia* Bory de St. Vincent, 1824  
*Filinia terminalis* (Plate, 1886)  
Phylum Arthropoda Latreille, 1829  
Subphylum: Crustacea Brünnich, 1772  
Subclass Phyllopoda Preuss, 1951  
Order Diplostraca Gerstaecker, 1866  
Suborder Cladocera Latreille, 1829  
Family Daphniidae Sars, 1875  
*Genus Daphnia* Müller, 1785  
*Daphnia longispina* Müller, 1875  
Family Bosminidae Baird, 1845  
*Genus Bosmina* Baird, 1845  
*Bosmina longirostris* (Müller, 1785)  
Class Maxillopoda Dahl, 1956  
Subclass Copepoda H.Milne-Edwards, 1840  
Infraclasse Neocopepoda Huys & Boxshall, 1991  
Superorder Gymnoplea Giebesbrecht, 1882  
Order Calanoidea Sars, 1930  
Family Diaptomidae Sars, 1903  
Genus *Acanthodiaptomus* Kiefer, 1932  
*Acanthodiaptomus denticornis* (Wierzejski, 1887)  
Superorder Podoplea Giesbrecht, 1882  
Order Cyclopoida Sars, 1918  
Family Cyclopoidae Sars, 1913  
Subfamily Cyclopinae Kiefer, 1927  
Genus *Cyclops* Müller, 1785  
*Cyclops vicinus* Uljanin, 1875  
Distribution of zooplankton species among 6 stations in Çat Dam Lake is given in Table 2.

Family Brachionidae was found as the most dominant group (with 5 species, \textit{K. cochlearis}, \textit{K. quadrata}, \textit{K. tecta}, \textit{K. longispina} and \textit{N. squamula}). In some dam lakes like Göksu (Bekleyen, 2003), Cip (Saler and Şen, 2000), Birecik (Bozkurt and Sagat, 2008), Beyhan (Bulut and Saler 2014), Kalecik (Bulut and Saler 2013) Dam Lakes species from Brachionidae represented most of the species.

In Çat Dam Lake \textit{K. cochlearis} and \textit{K. quadrata} were the most abundant species in this study followed by \textit{Lecane} spp. Among zooplankton groups Rotifera was observed in high number of individuals and species diversity. This profile was in accordance with zooplankton distribution of dam lakes in Turkey (Bekleyen, 2003; Kaya and Altındağ, 2007; Özdemir Mis et al., 2009; Saler and İpek Alış, 2014; Saler et al., 2014).

The first Turkish inland water zooplankton list was made by Emir (1996) and she reported 167 species. Ustaoğlu (2004), reported 229 rotifer species from Turkish inland waters. In the Tigris River Bekleyen \textit{et al}. (2011) identified 34 new Rotifer species. Ustaoğlu \textit{et al}. (2012) recorded 341 rotifer taxa from Turkey. Ustaoğlu (2015), updated the rotifer species number as 417. Among these rotifer species \textit{L. intrasinuata} has not been mentioned (Fig. 2).

\hline
\end{tabular}
\caption{Table 2 continued:}
\end{table}
Differential diagnosis

*L. intrasinuata* is confused with *L. stichaea*. *L. intrasinuata* has got a smooth lorica and the width of its lorica is greater than that of *L. stichaea*. Its ventral plate width is about two thirds of its length and the plate is slightly swollen. The foot is shorter than in *L. flexilis*, and the presence of pseudoclaws distinguishes the species from *L. halicysta*, *L. stichoclysta* and *L. verecunda*.

Description

Lorica is stiff, dorsal plate is anteriorly narrower, and medially wider than the ventral plate. The plate is smooth. Head aperture margins are dorsally and ventrally slightly convex or straight, coincident, with small antero-lateral spines. Ventral plate is longer than its width. Lateral margins curved, irregularly undulate, with anterior notches. Toes are parallel-sided, bearing pseudoclaws.

Measurements

DPI. 52-135, DPw. 68-101, VPI. 56-125, VPw. 36-76, toe 15-26, claw 4-6.

Distribution

According to Segers (1995), it was found in the northern temperate zone only. He also reported a record from a pond near Alexandrowsk from Norway Fig. 2.
